"A record label for software." One AI-native builder shipping like an org. First release: EOLkits.

On a 2017 laptop, for ~\$300/month, I've shipped **40+ systems solo** (~1.5M lines of code, **~13 live in production**). The first I'm taking to market — **EOLkits** — is live on Stripe and points at a market with a deadline: AWS's 2026–2027 runtime deprecations.

## — The Wedge — EOLkits

AWS deletes runtimes on a hard public calendar (Amazon Linux 2 ended June 30, 2026; Lambda Python/Java deprecate in waves through 2027) — teams find out when a deploy fails. EOLkits is a free, open-source CLI per deadline:

### 1 · SCAN

#### Detect

Affected runtimes, instantly

### 2 · REWRITE

#### Migrate

Deterministic code migration

### 3 · PATCH

#### Infra

Six IaC formats covered

### 4 · ROLLOUT

#### Ship

Staged canary + auto-rollback

**Plus:** a GitHub Action, a free browser **/scan**, deterministic audit PDFs, and a GitHub bot that opens the migration PR and **refunds itself if CI fails**. Live at eolkits.com — ~24,500 LOC, ~170+ tests, live Stripe.

## — Market

**\$20.7B**

#### Cloud Migration

2025 · ~28% CAGR

**\$22.7B**

#### App Modernization

Growing to \$40B+/yr

AWS's own "AWS Transform" validates demand and names the competition. AWS serves the enterprise top — **EOLkits owns the long tail**.

## — Traction — Honest

**\$0**

Revenue / MRR

**0**

Customers

**~260**

Cold emails → 0 replies

Everything is built, live, and revenue-wired. The launch was built and never fired. The bottleneck is **distribution and one proof point** — not building.

## — Business Model — Open-Core

### Free MIT CLIs

Distribution layer

### Audit

**\$299–599**

### Migration Pack

**\$1,499**

### PR Bot

**Per-use**

### Drift Watch

**\$19/mo**

### Org License

**\$14,999/yr**

**~95% margin**. Break-even on the first sale. Whole company runs at ~\$300/month.

## — The Ask

**\$250K** SAFE or Accelerator · ~18 mo runway

**Goal:** land EOLkits's first paying customers before the Feb–Mar 2027 AWS Lambda deprecation wave.

**Use of funds:** modest founder living wage (Boston/NYC, low-benchmark) · minimal compute/tooling · real distribution budget — not servers (non-dilutive credits cover compute).

## — The Unfair Advantage — GRACE

One cheap VPS running **16 live products** that writes its own missing features (detect → design → generate → sandbox → hot-load), holding inference near **~\$3/month**. It's why one person ships like a team. MIT-licensed and inspectable. Live at graceai.love.

**The deadline is public and immovable.** AWS Lambda Python/Java deprecations hit in waves through 2027. EOLkits is already built, live, and priced. The only missing ingredient is distribution.
