

Toledo Technologies

"A record label for software."

One AI-native builder shipping like an org. First release: EOLkits.

Nick Toledo · Fairfield, CT · dev@toledotechnologies.com ·

An abstract graphic on the left side of the slide. It features a CD or vinyl record with a blue and purple color scheme. Liquid, also in blue and purple, is splashing and flowing around the CD, creating a dynamic, artistic effect.

The 10-second version

On a 2017 laptop, for ~\$300/month, I've shipped 40+ systems solo. The first one I'm taking to market — EOLkits — is live on Stripe and points at a market with a deadline: AWS's 2026–2027 runtime deprecations.

40+

Systems Shipped

~13

Live in Production

\$0

Revenue

The raise fixes distribution, not building.

The Problem

AWS deletes runtimes on a hard public calendar. Amazon Linux 2 ended June 30, 2026; Lambda's Python and Java runtimes deprecate in waves through 2027.

Teams find out when a deploy fails — usually the ones with no platform team and no enterprise migration budget. The pain is dated, recurring, and non-negotiable.

Hard Deadline

Amazon Linux 2 ended June 30, 2026. Lambda runtimes deprecate in waves through 2027.

Who Gets Hit

Teams with no platform team and no enterprise migration budget — they find out when a deploy fails.

The Nature of the Pain

Dated, recurring, and non-negotiable.

The Product — EOLkits

One free, open-source CLI per deadline: scan your AWS account → rewrite the broken code deterministically → patch infrastructure across six IaC formats (SAM, CloudFormation, CDK, Terraform, Serverless, Ansible/Packer) → staged canary rollout (5→25→50→100%) with automatic rollback.
Plus a published GitHub Action, a free browser /scan, deterministic audit PDFs, and a GitHub bot that opens the migration PR and refunds itself if CI fails.
Live at eolkits.com — ~24,500 lines of code, ~170+ automated tests, live on Stripe.

Business Model & Market

Open-Core Pricing

The CLIs are free (MIT) — distribution, not charity. Revenue is the done-for-you layer:

- Audit \$299 (rising to \$399 / \$599 near a deadline)
- Migration Pack \$1,499
- GitHub PR bot
- Drift Watch \$19/mo
- Org License \$14,999/yr

~95% gross margin, break-even on the first sale; the whole company runs at ~\$300/month.

The Market

Cloud-migration services ~\$20.7B (2025, ~28% CAGR) + application modernization ~\$22.7B → a \$40B+/year pool. AWS itself ships "AWS Transform" — validating demand and naming the competition. AWS serves the enterprise top; EOLkits owns the long tail.

Honest near-term SOM: a handful of paid audits around the 2026–2027 cliffs, not a slice of a TAM.

Why Now

Two clocks strike at once. The AWS deprecation calendar (2026–2027) creates urgency I don't have to manufacture. And AI-leveraged building has crossed from novelty to advantage: Sequoia is underwriting "agentic leverage," solo founders are ~36% of new ventures, and the first solo-founder unicorn is openly predicted for 2026.

"I'm not the exception to fund reluctantly — I'm the thesis, already built."

AWS Deprecation Calendar

2026–2027 deadlines create urgency that doesn't need to be manufactured.

Agentic Leverage

Sequoia is underwriting it. Solo founders are ~36% of new ventures. The first solo-founder unicorn is openly predicted for 2026.

The Unfair Advantage — GRACE

The platform behind all of it: one cheap VPS that hosts and runs 16 live products and extends itself — when it hits a capability it lacks, it designs the module, generates the code, sandbox-tests it, and hot-loads it with no restart. A cost-router holds inference near ~\$3/month; 11 self-healers keep it alive.

This is why one person ships like a team — and it's MIT-licensed and inspectable.

16 Live Products

One cheap VPS hosts and runs them all simultaneously.

Self-Extending

Designs the module, generates the code, sandbox-tests it, and hot-loads with no restart.

11 Self-Healers

Cost-router holds inference near ~\$3/month. Always alive.

MIT-Licensed

Fully inspectable. Not a black box.

Traction — The Honest Position

\$0

0

Customers

\$0

MRR

Stated plainly.

What's real: everything is built, live, and revenue-wired — the launch was built and never fired, and the brand is anonymous.

~260 cold emails → 0 replies. That's the proof the bottleneck is distribution and one external proof point, not capability.

"No amount of additional building changes a \$0 with no distribution — and that's exactly what this raise addresses."

The Founder

Nick Toledo — self-taught, AI-native, solo. 40+ original systems, ~1.5M lines of code across 8 languages, ~13 live in production, all on a 2017 MacBook at ~\$300/month, all public on GitHub.

After leaving a job in mental health, I set out to make a difference in other ways and bet on AI-leveraged building. I'm a maker of raw iron — velocity and range. I need the partners to forge it into distributed products.

The Ask, the Plan, and the Vision

Raising ~\$250K (SAFE or accelerator) → ~18 months of full-time runway to land EOLkits's first paying customers before the Feb–Mar 2027 AWS Lambda deprecation wave.

Use of funds: a modest founder living wage (Boston/NYC, at the low end of pre-seed benchmarks), minimal compute and tooling, and a real distribution budget. Not servers — non-dilutive cloud credits cover compute. The milestone: land the first external proof point — a paid audit, real installs, live scan traffic — then compound into the next wedge.

"Fund the forge, and a portfolio of raw iron becomes a catalog of shipped, distributed products."

~\$250K Raise

SAFE or accelerator

~18 Months Runway

Full-time, focused on distribution

The Milestone

First paid audit, real installs, live scan traffic — before Feb–Mar 2027
