

Toledo Technologies

A RECORD LABEL FOR SOFTWARE

One AI-native builder shipping like an org. On a 2017 laptop, for ~\$300/month: **40+ systems, ~13 in production**. First release to market: EOLkits, live on Stripe.

The Wedge — EOLkits

The Problem

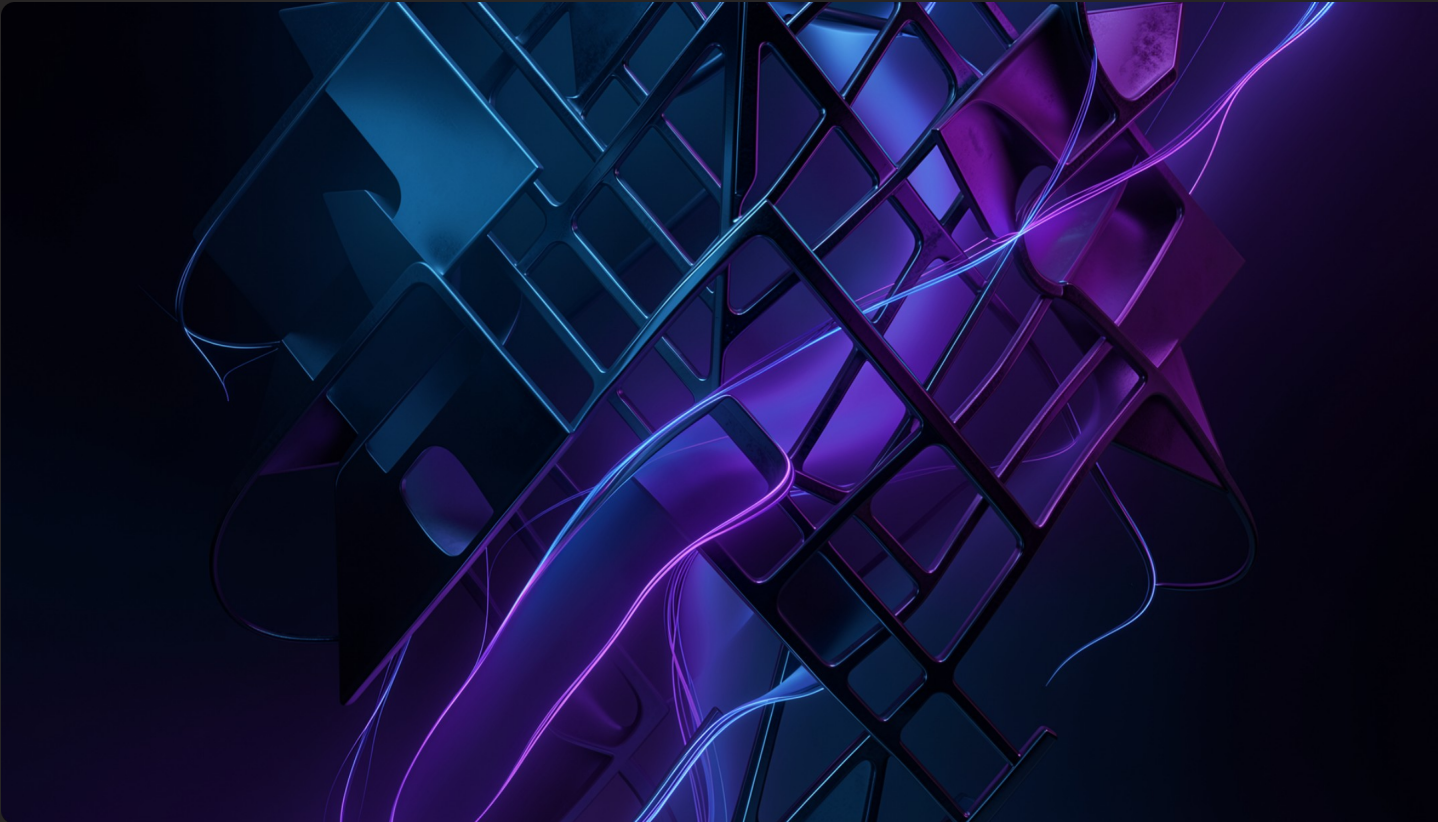

AWS deletes runtimes on a hard public calendar — **Amazon Linux 2 ended June 30, 2026; Lambda Python/Java deprecate through 2027** — and teams find out when a deploy fails.

The Solution

EOLkits is a **free, open-source CLI** that scans your AWS account, rewrites the broken code, patches your infrastructure, and rolls it out safely — with a **\$299 audit** and a GitHub bot that opens the migration PR. Live at **eolkits.com**. Open-core, **~95% margin**.

Why One Person Can Do This

GRACE

A platform I built that runs **16 live products** off one cheap VPS and writes its own missing features, holding inference near **~\$3/month**. It's why a solo, self-taught founder ships like a team.

Honest Position

\$0 revenue, 0 customers. Everything is built, live, and revenue-wired — the bottleneck is distribution and one proof point, not building. **~260 cold emails → 0 replies** proves it.

The Ask

Raising ~\$250K

~18 months of full-time runway to land EOLkits's first paying customers before the **Feb-Mar 2027 AWS Lambda deprecation wave**.

The Vision

"Fund the forge, and a portfolio of raw iron becomes a catalog of shipped, distributed products."
